

Harnessing Big Data for National Statistics and Evidence-Based Policymaking

Blantyre, August 2025

Introduction: Big Data for Policymaking

Joshua Blumenstock

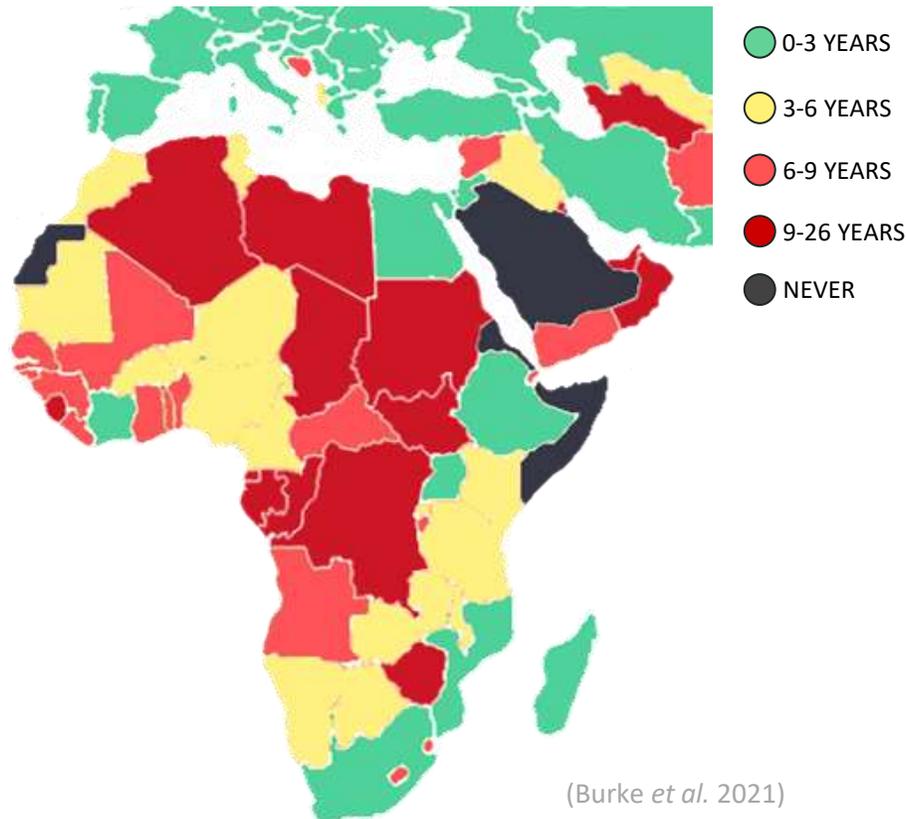

Harnessing Big Data for National Statistics and Evidence-Based Policymaking

Blantyre, August 2025

Motivation: Data Gaps

Many countries lack reliable, up-to-date data

Avg. gap between economic surveys, 1993 - 2021

- Typical household survey costs \$10+ million; census-scale sweep costs \$50+ million
- Less than half of the poorest countries have completed a census in past 10 years

Motivation: Data Gaps

Why are **data gaps** a problem?

nature
International journal of science

Kofi Annan 

WORLD VIEW • 28 FEBRUARY 2018

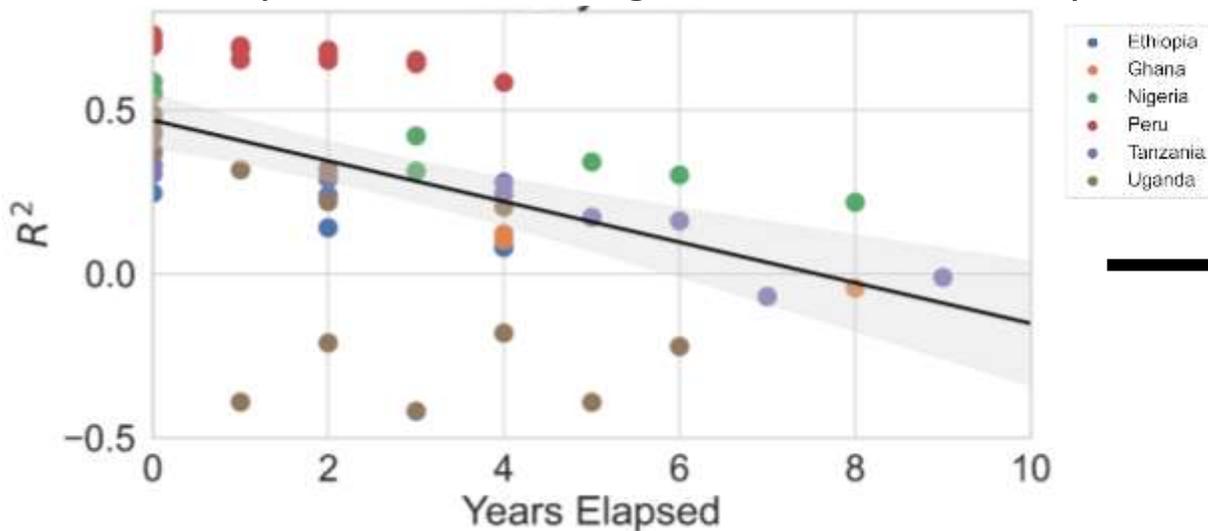

“Data gaps undermine our ability to target resources, develop policies and track accountability. Without good data, we’re flying blind. **If you can’t see it, you can’t solve it...**”

Example: Social protection programs

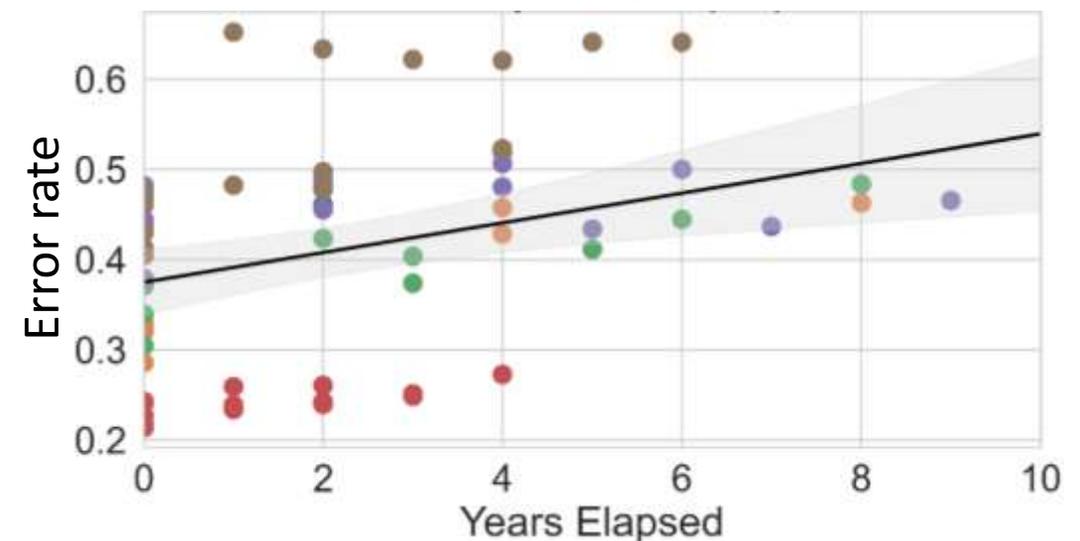

As data go out of date, **policies and interventions are less effective**

- For example, in a social protection program the size of PROGRESA (MEXICO), out of date data would result in **hundreds of thousands of exclusion errors each year**

Accuracy of means testing since date of survey

Error rate of targeted policy

This talk: Outline

The potential for **big data** in national statistics and policy

- Motivation
- **What data, and why should we care?**
- Case Study: Nigeria
- Case Study: Togo
- Summary and Reflections

New Data: What are we talking about?

The last decade has seen a proliferation of non-traditional data:

Remote sensing: High-resolution imagery available daily

Mobile phones: 96% mobile phone penetration globally

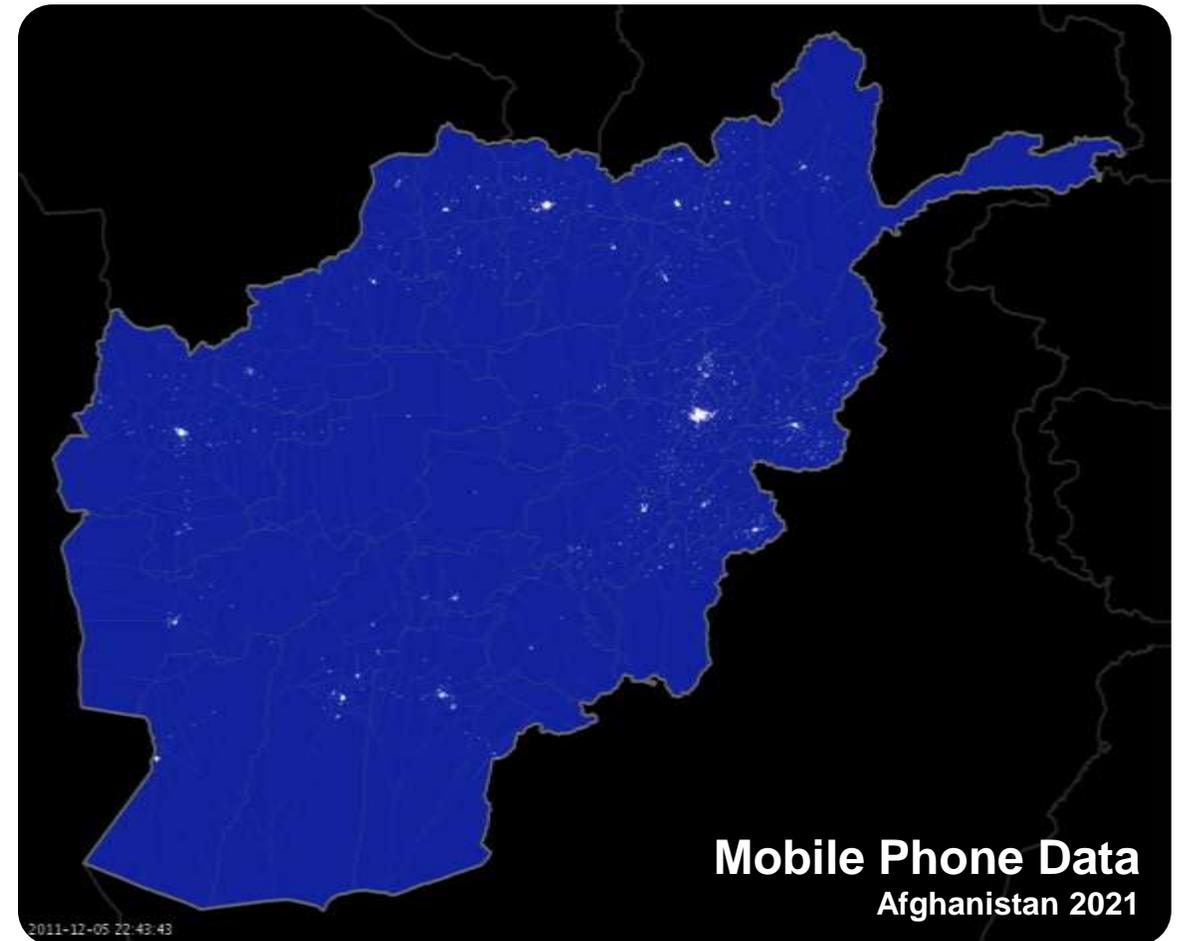

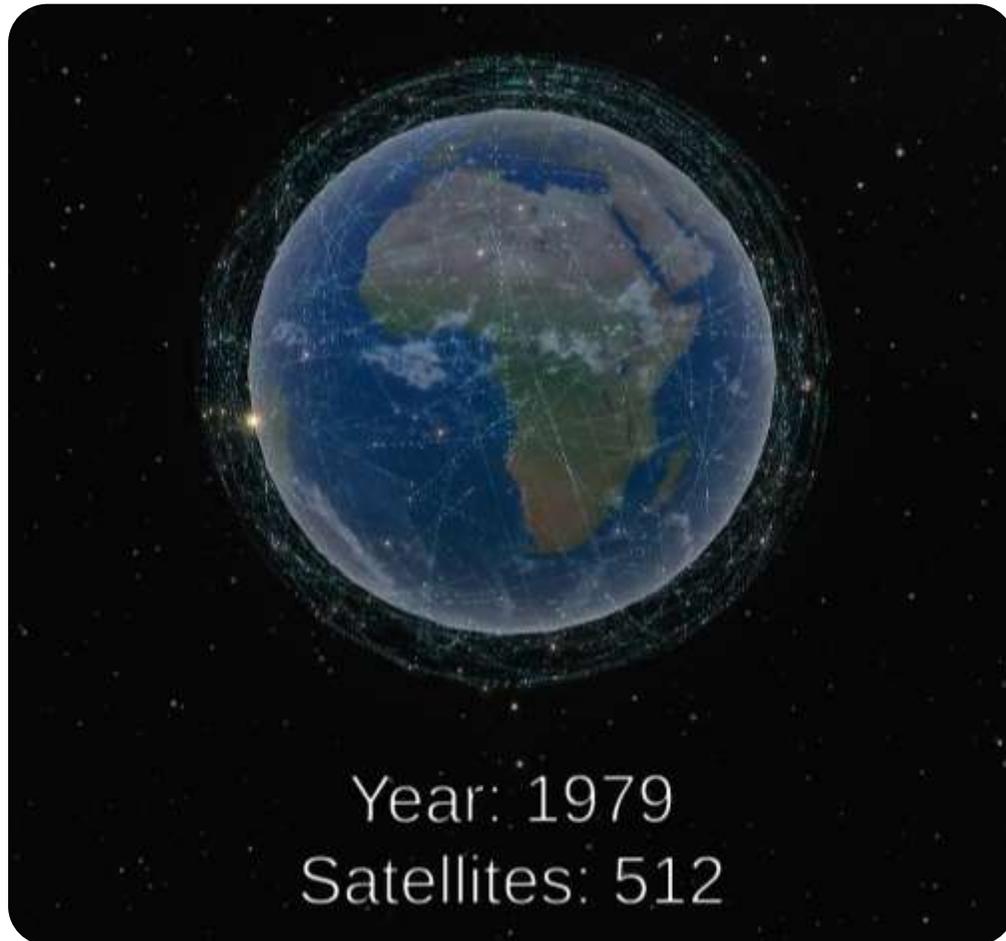

Digital traces: 3.2 billion active Facebook users

Other sources:

Satellite and Phone data

New forms of data are available even in poor/remote regions

Big data and policymaking: **Relevance**

Why are these data “suddenly” relevant to policymaking?

Explosion in data availability

Satellites, remote sensing, mobile phones, digital government records, admin data, networked sensors

Policy demand for timely, evidence-based decisions

Ability to systematically maximize impact, real-time insights to inform rapid interventions

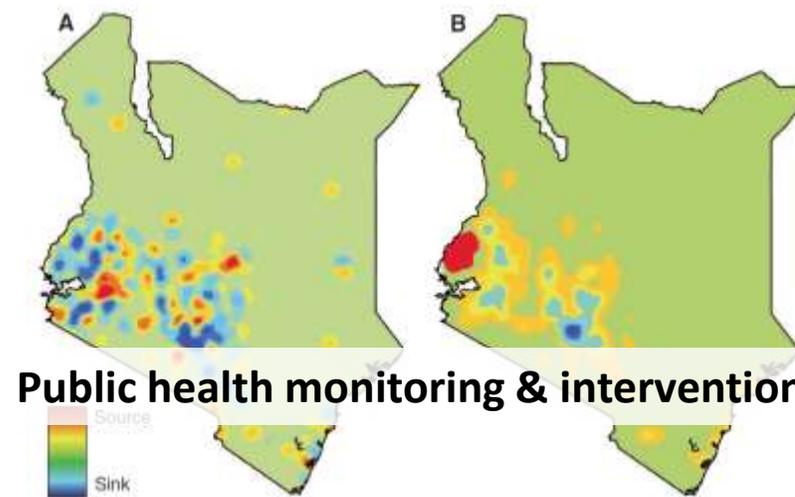

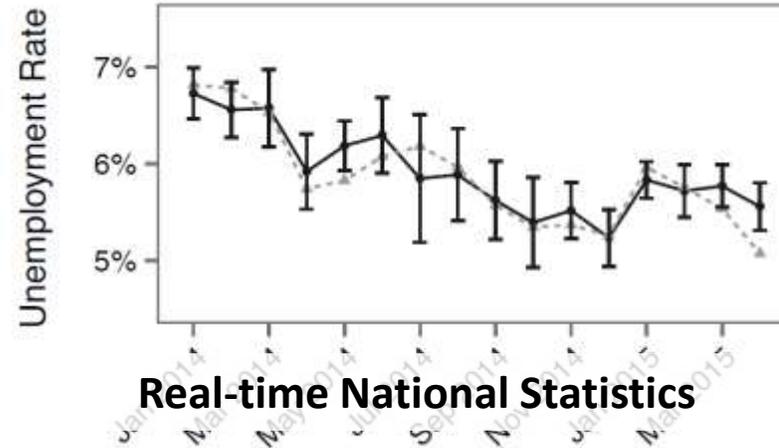

Advances in computing and cloud infrastructure

High-speed computing and affordable cloud storage

Improved algorithms and open-source tools

Modern machine learning tools integrated into common frameworks, point-and-click dashboards

Big data and policymaking: **Example Use Cases**

This talk: Outline

The potential for **big data** in national statistics and policy

- Motivation
- What data, and why should we care?
- **Case Studies**
- Summary and Reflections

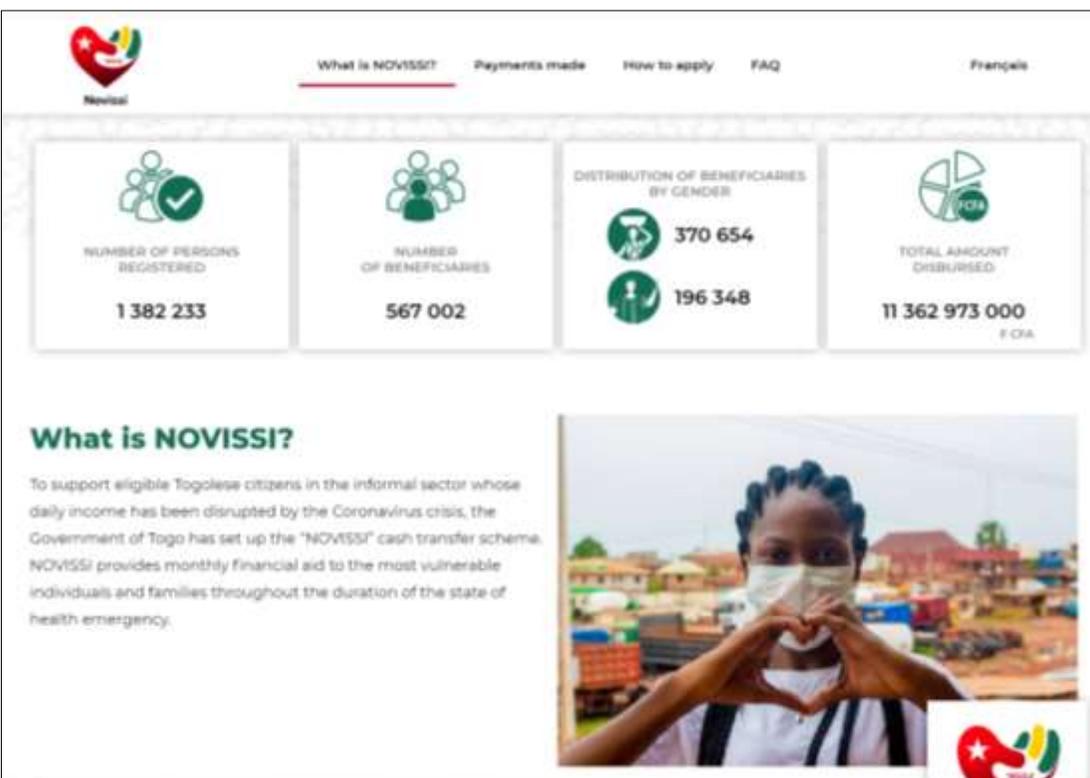

Case Study: Togo's Novissi Program

Case Study: Togo

Novissi: Togo's immediate response to the Covid-19 pandemic

- Beneficiaries received bi-weekly payments of roughly \$10 USD
- 100% digital registration (USSD) and payment (mobile money)

The challenge of targeting

A key challenge: *Who should be eligible for benefits?*

- At the onset of the pandemic, Togo did not have a complete social registry
 - The last census was conducted in 2011
 - Not possible to update in the middle of a public health crisis
- In early 2020, Minister Lawson asked if we could build a poverty map
 - She had seen our work on poverty mapping in Nigeria
 - Her idea was to use those maps to direct resources to the poorest cantons

Nigeria: Policy need

Like Togo, Nigeria had urgent need for an up-to-date poverty map

- World Bank agreed to finance an urban anti-poverty program
- But: existing survey data did not allow for ward-level decisions

← **States (adm-2):** 100% of wards had data

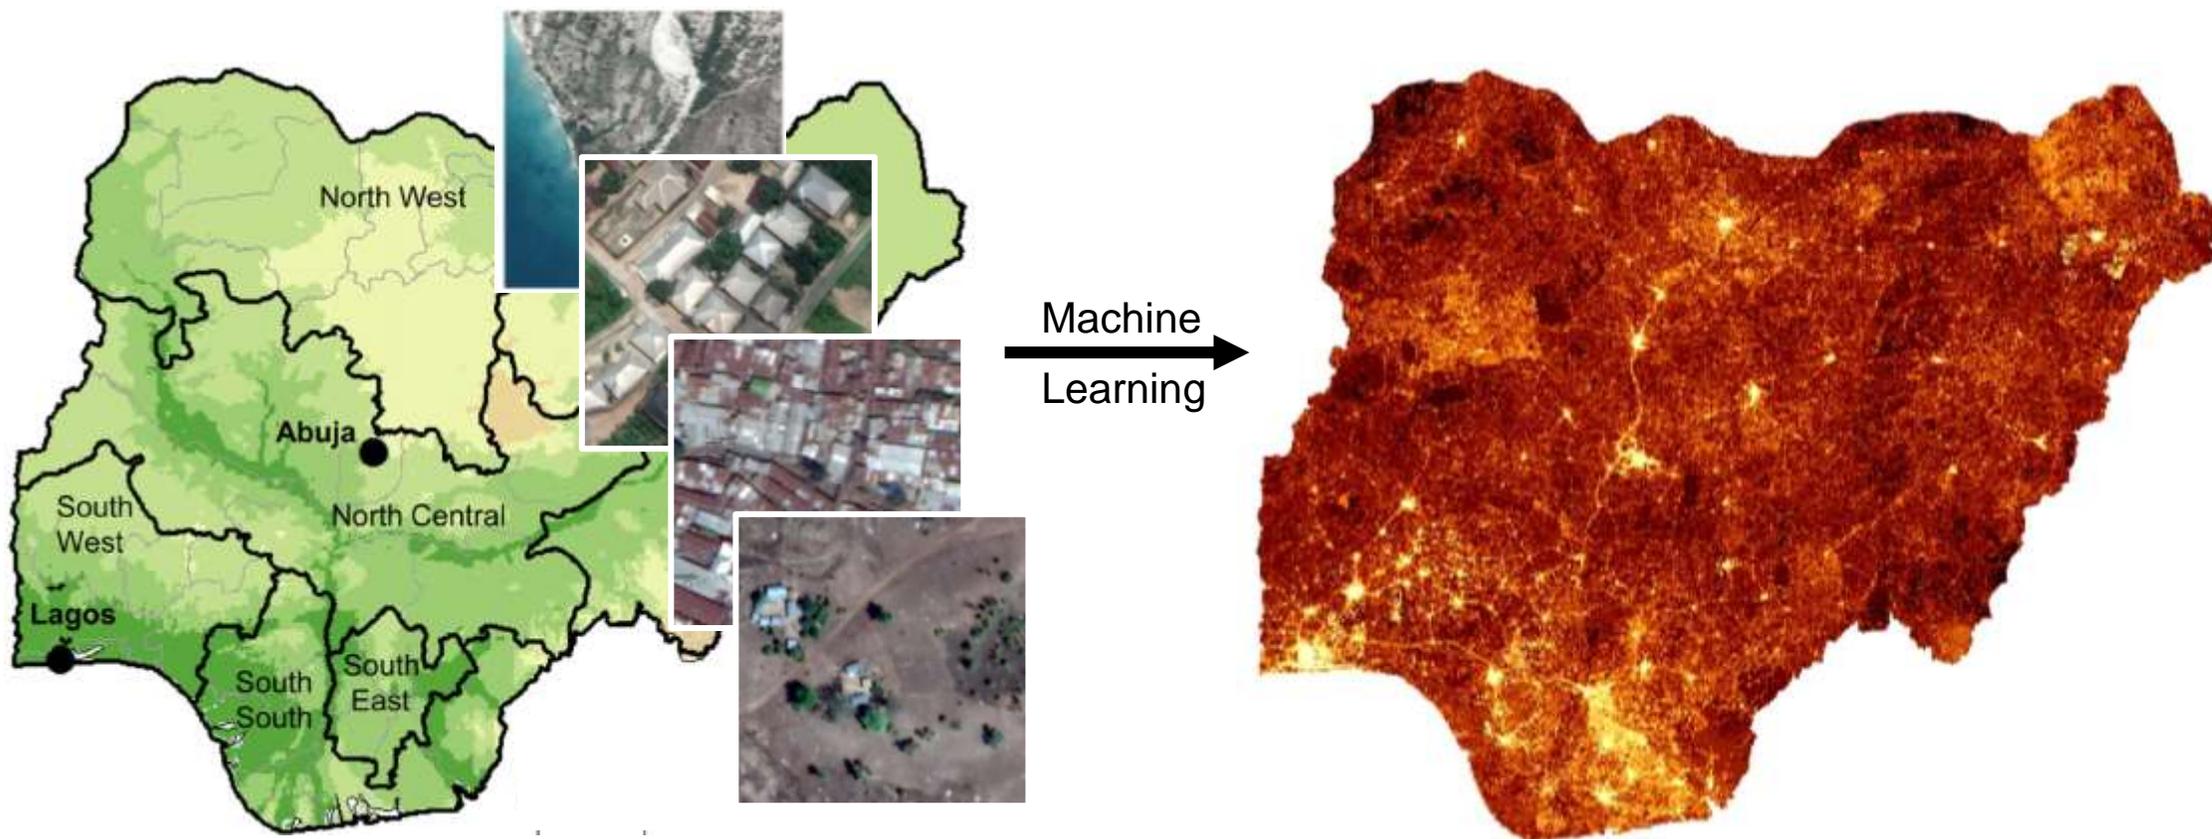

← **LGA (adm-3):** 81.5% of LGAs had data

← **Ward (adm-4):** Only 13.8% of wards had data!

Nigeria: Our objective

Our objective was to use satellite imagery, processed with AI, to produce a high-resolution poverty map for the government

Nigeria: Intuition

A simple idea 💡 : wealthy regions *look* different from poor regions

- We use AI to learn these patterns at a national scale

Wealth estimate (satellite)	-0.64

Nigeria: Conclusion

The new poverty maps were as accurate as the old ones

- And: **100% coverage** nationally, at **extremely high resolution**
- They allowed the Nigerian government to prioritize the poorest wards

A Clever Strategy to Distribute Covid Aid—With Satellite Data

These new poverty maps could reshape how we deliver international aid

Granular geographic targeting, down to 2-by-2-kilometer squares, may help pinpoint the very poorest who need urgent financial assistance—and COVID-19 vaccines.

Geographic microtargeting of social assistance with high-resolution poverty maps

Isabella S. Singer and Joshua B. Blumenstock

Edited by Karen Saks, Yale University, New Haven, CT; received November 9, 2021; accepted June 7, 2022

Hundreds of millions of poor families receive some form of targeted social assistance. Many of these antipoverty programs involve some degree of geographic targeting, where aid is prioritized to the poorest regions of the country. However, policy makers in many low-income settings lack the disaggregated poverty data required to make effective geographic targeting decisions. Using several independent datasets from Nigeria, this paper shows that high-resolution poverty maps, constructed by applying machine-learning algorithms to satellite imagery and other nontraditional geospatial data, can improve the targeting of international cash transfers to those families. Specifically, we

Significance

Many antipoverty programs use geographic targeting to prioritize benefits to people living in specific locations. This paper shows that high-resolution poverty maps

Togo: Targeting with phone data

This led us to ask: **Can phone data help us prioritize poorest?**

- The idea 💡 : Wealthy people use phones differently than poor people
- In Rwanda, we'd shown that predictive algorithms can accurately estimate wealth

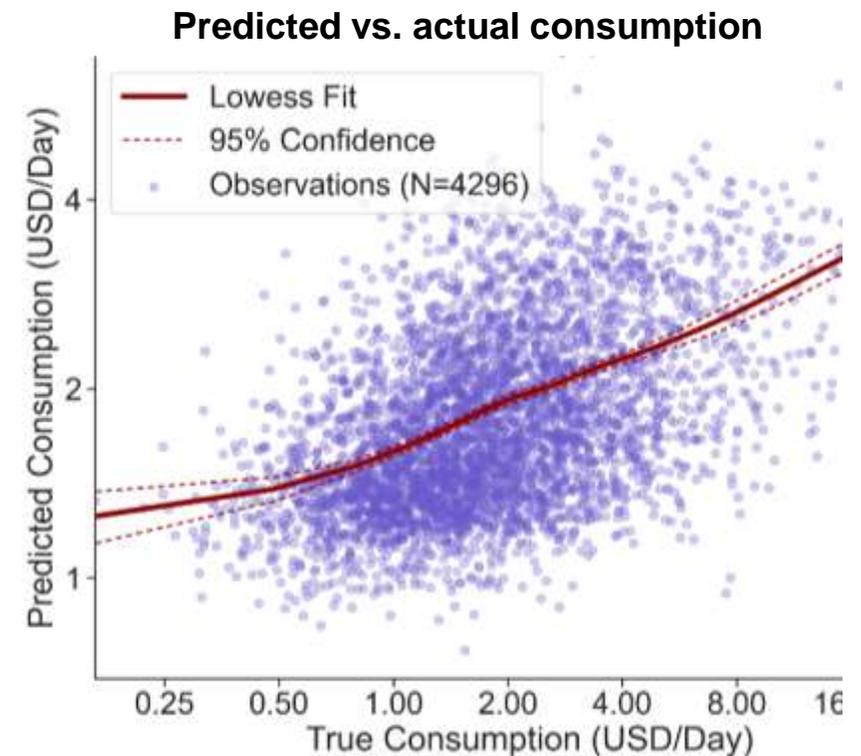

Togo: Targeting with phone data

In Togo, we found that using phone data (and machine learning), we could **predict the total consumption** of each mobile subscriber

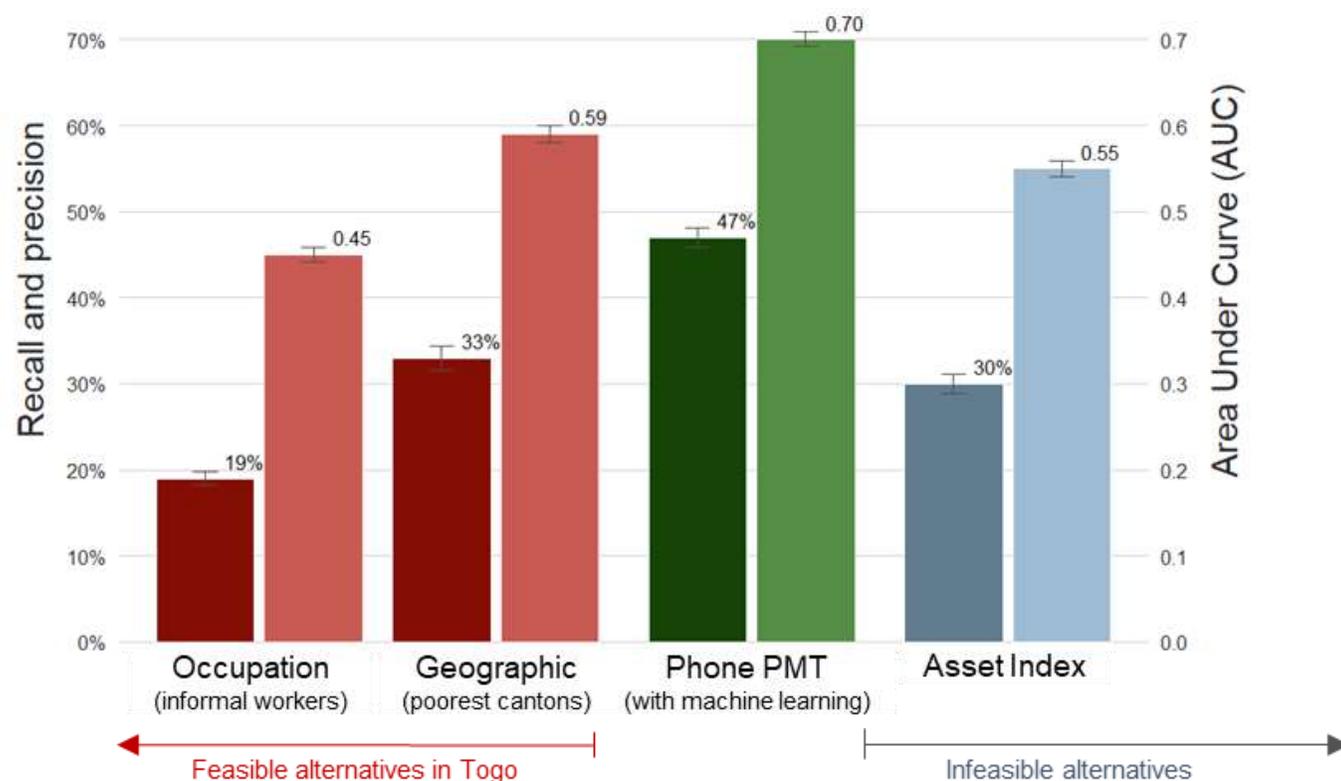

Asset	Consumption	PMT	Asset Index
<i>Prediction Accuracy (N = 4,171)</i>			
Machine Learning	0.46	0.62	0.74
“Intuition” model	0.13	0.16	0.11

Correlation between predicted value and “ground truth” measured in survey

Togo: Key finding

Using a combination of phone data and machine learning, the government **reduced exclusion errors** by roughly 50%

- **Summary and Reflections**

Togo and Nigeria: Summary

In Togo and Nigeria, big data allowed policymakers to **design and implement more effective policies**

Nigeria: Satellite data

Output: High-resolution poverty maps

Result: Cash targeted to poorest urban wards

Togo: Mobile phone data

Output: Predicted poverty of each subscriber

Result: Cash targeted to poorest subscribers

Big Data for Policy: Summary

To unlock such applications and innovation requires careful planning (more on this later today!)

Regulation and Governance

Frameworks required to enable ethical, inclusive, and responsible use of data

Access and Incentives

Institutional and financial support for innovation; incentives for companies to share data

Capacity

Invest in training, tools, and partnerships; especially local data science capacity

Collaboration

Leverage universities, international agencies, local innovators, and local industry

Big Data for Policy: Summary

The **policy need**

- Traditional data sources are costly to maintain, and often incomplete
- This hinders policymakers' ability to make effective, evidence-based decisions

The **opportunity**

- New data sources are now widespread, even in remote areas
- Advances in computing & AI make it possible to analyze big data in real-time

The **challenges**

- Big data and AI are not a silver bullet!
- They should complement, not replace traditional approaches
- Innovation must be responsible and equitable
